

Episode-12 - Let's Build our store

* Architecture of Redux Toolkit:

- ⇒ **Redux Store:** Redux store is a big object and it is kept in a central global place.
- ⇒ cart & user are slice.
- ⇒ When you click on the 'ADD' button, it dispatches an action that called a function, and this function internally modify the cart.
- ⇒ Function is known as 'reducer' function.
- ⇒ **In other words:** When we click on 'ADD' button it dispatches an action which calls the 'reducer' function which modifies the 'slice' of the 'Redux store'.
- ⇒ If you read the data from 'cart slice' to cart (Header Component), we will use 'selector' and this selector will give you data here.
- ⇒ selector is known as subscribing to the store.

★

★ #Redux Toolkit:

- Install Redux Toolkit and react-redux
@reduxjs/toolkit and react-redux
- Build our store
- Connect our store to our App
- Create a slice (cartSlice)
- dispatch(action)
- Read the data using selector
